

Supplementary Materials:

mtDNA-FM: A Domain-Specialized Foundation Model for Mitochondrial DNA

S1. Hyperparameters

S1.1 Pre-training

Table 1: Pre-training hyperparameters for Phase 1 and Phase 2.

Hyperparameter	Phase 1	Phase 2
Training steps	50,000	25,000
Warmup steps	2,000	500
Peak learning rate	1×10^{-4}	5×10^{-5}
LR schedule	Cosine decay	Cosine decay
Batch size (effective)	256	256
Gradient accumulation steps	8	8
Optimizer	AdamW ($\beta_1 = 0.9, \beta_2 = 0.999$)	AdamW
Weight decay	0.01	0.01
Gradient clipping	1.0	1.0
MLM masking probability	0.15	0.15
Heteroplasmy loss weight (λ_{het})	0.0	0.3
Checkpoint rotation	Keep last 3	Keep last 3
Gradient checkpointing	Yes	Yes

S1.2 Model Architecture

S1.3 Fine-tuning Hyperparameters

S2. Mathematical Derivation: Circular Positional Encoding

S2.1 Standard sinusoidal PE

In the original Transformer vaswani2017attention, position p is encoded as:

$$\text{PE}(p, 2i) = \sin\left(\frac{p}{10000^{2i/d}}\right) \quad (1)$$

$$\text{PE}(p, 2i + 1) = \cos\left(\frac{p}{10000^{2i/d}}\right) \quad (2)$$

For a sequence of length L , $\text{PE}(0, \cdot) \neq \text{PE}(L - 1, \cdot)$ in general. As $d \rightarrow \infty$, the angle between $\text{PE}(0)$ and $\text{PE}(L - 1)$ grows monotonically with L .

Table 2: mtDNA-FM architecture hyperparameters.

Parameter	Value
Hidden size (d)	256
Number of transformer layers	6
Number of attention heads	8
Feed-forward intermediate size	1,024
Attention head dimension	32
Dropout	0.1
Attention dropout	0.1
Max position embeddings	514 (512 + [CLS] + [SEP])
Vocabulary size	4,102
Activation function	GELU
Layer normalization ϵ	10^{-12}
Total parameters	$\approx 5.8\text{M}$
Positional encoding	Circular sinusoidal (fixed buffer)
Genome length for circular PE	16,569 bp (rCRS)

Table 3: LoRA fine-tuning hyperparameters for each downstream task.

Hyperparameter	Haplogroup	Pathogenicity	Heteroplasmy
LoRA rank (r)	8	4	4
LoRA α	16	8	8
LoRA dropout	0.05	0.05	0.05
LoRA target modules	Q, V	Q, V	Q, V
Learning rate	1×10^{-3}	5×10^{-4}	5×10^{-4}
Epochs	20	30	30
Batch size	32	16	16
Loss function	Cross-entropy	BCE ($w_+ = 2.5$)	Huber ($\delta = 1.0$)
Weight decay	0.0	0.1	0.1
Input representation	CLS token	Variant position token	CLS token

S2.2 Circular modification

We replace p with the circular angle $\phi_p = 2\pi p/L_{\text{genome}}$:

$$\text{PE}_{\text{circ}}(p, 2i) = \sin\left(\frac{2\pi p/L_{\text{genome}}}{10000^{2i/d}}\right) \quad (3)$$

$$\text{PE}_{\text{circ}}(p, 2i + 1) = \cos\left(\frac{2\pi p/L_{\text{genome}}}{10000^{2i/d}}\right) \quad (4)$$

At $p = L_{\text{genome}}$:

$$\phi_{L_{\text{genome}}} = \frac{2\pi L_{\text{genome}}}{L_{\text{genome}}} = 2\pi$$

and $\sin(2\pi) = \sin(0) = 0$, $\cos(2\pi) = \cos(0) = 1$.

Therefore $\text{PE}_{\text{circ}}(L_{\text{genome}}, \cdot) = \text{PE}_{\text{circ}}(0, \cdot)$, which is the desired circular continuity property.

S2.3 Properties

- *Uniqueness*: Positions p and p' with $|p - p'| < L_{\text{genome}}/2$ receive distinct encodings (the mapping $p \mapsto \phi_p$ is injective on $[0, L_{\text{genome}})$).

- *Smoothness at junction:* $\|\text{PE}_{\text{circ}}(p) - \text{PE}_{\text{circ}}(p + 1)\|$ is constant across all positions including $p = L_{\text{genome}} - 1$ (the circular junction), whereas for standard sinusoidal PE this distance jumps at position 0.
- *Non-learnable:* Implemented as `nn.Buffer`, not `nn.Parameter`; gradients do not flow through the positional encoding.

S3. Per-class Haplogroup Metrics

Results from LoRA fine-tuning under CPU compute constraints (2 epochs; class collapse to haplogroups D, G, R). Non-zero recall for D (24.4%), G (62.3%), and R (13.6%) reflects the partial model: these three haplogroups have the largest training window counts and were the only predicted classes. All other classes have zero recall due to class collapse. See Section 4.2 of the main text for full discussion.

Table 4: Per-class haplogroup classification metrics from LoRA fine-tuning (CPU, 2 epochs). N test refers to the number of test windows (not sequences) per class; each genome contributes ≈ 65 windows.

Haplogroup	Precision	Recall	F1	N windows
A	0.000	0.000	0.000	3,250
B	0.000	0.000	0.000	7,215
C	0.000	0.000	0.000	4,160
D	0.040	0.244	0.069	2,925
E	0.000	0.000	0.000	390
F	0.000	0.000	0.000	2,145

S4. Dataset Summary

S5. DVC Pipeline

The complete analysis pipeline is managed with DVC. The following stages are defined:

Table 5: Datasets used in this study.

Dataset	Source	Size	Purpose	Version/Date
HmtDB	clima2017hmtdb	47,000 seqs	Phase 2 pre-train, fine-tune	Retrieved 2024
NCBI vertebrate mtDNA	NCBI Entrez	117,615 seqs	Phase 1 pre-train	Retrieved 2024
PhyloTree	vanoven2009phylotree	26 major groups	Haplogroup labels	Build 17
gnomAD v3.1 chrM	karczewski2020gnomad	~5,000 vars	Benign variants	v3.1
ClinVar	landrum2018clinvar	~2,000 vars	Pathogenic variants	2024-01
MITOMAP	lott2013mitomap	~X vars	External validation	Accessed 2024
HelixMTdb	bolze2019helixmtdb	~X vars	External validation	v1

1. `download_hmtdb`: Download and cache HmtDB sequences
2. `download_ncbi`: Download vertebrate mtDNA from NCBI Entrez
3. `download_variants`: Download gnomAD, ClinVar, PhyloTree variant data
4. `preprocess`: Quality filter, normalize to rCRS length, train/val/test split
5. `build_vocabulary`: Construct 4,102-token k-mer vocabulary
6. `pretrain_phase1`: Phase 1 cross-species pre-training (50k steps)
7. `pretrain_phase2`: Phase 2 human specialization (25k steps)
8. `finetune_haplogroup`: LoRA fine-tuning for haplogroup classification
9. `finetune_pathogenicity`: LoRA fine-tuning for pathogenicity prediction
10. `finetune_heteroplasmy`: LoRA fine-tuning for heteroplasmy regression
11. `evaluate`: Compute all metrics, generate evaluation reports

Reproduce the full pipeline: `dvc repro`

S6. Ablation Learning Curves

Ablation training curves (circular PE vs. sinusoidal PE vs. learnable PE; two-phase vs. single-phase training; with vs. without heteroplasmy channel) will be included in the next version of this preprint following GPU-accelerated ablation runs.
